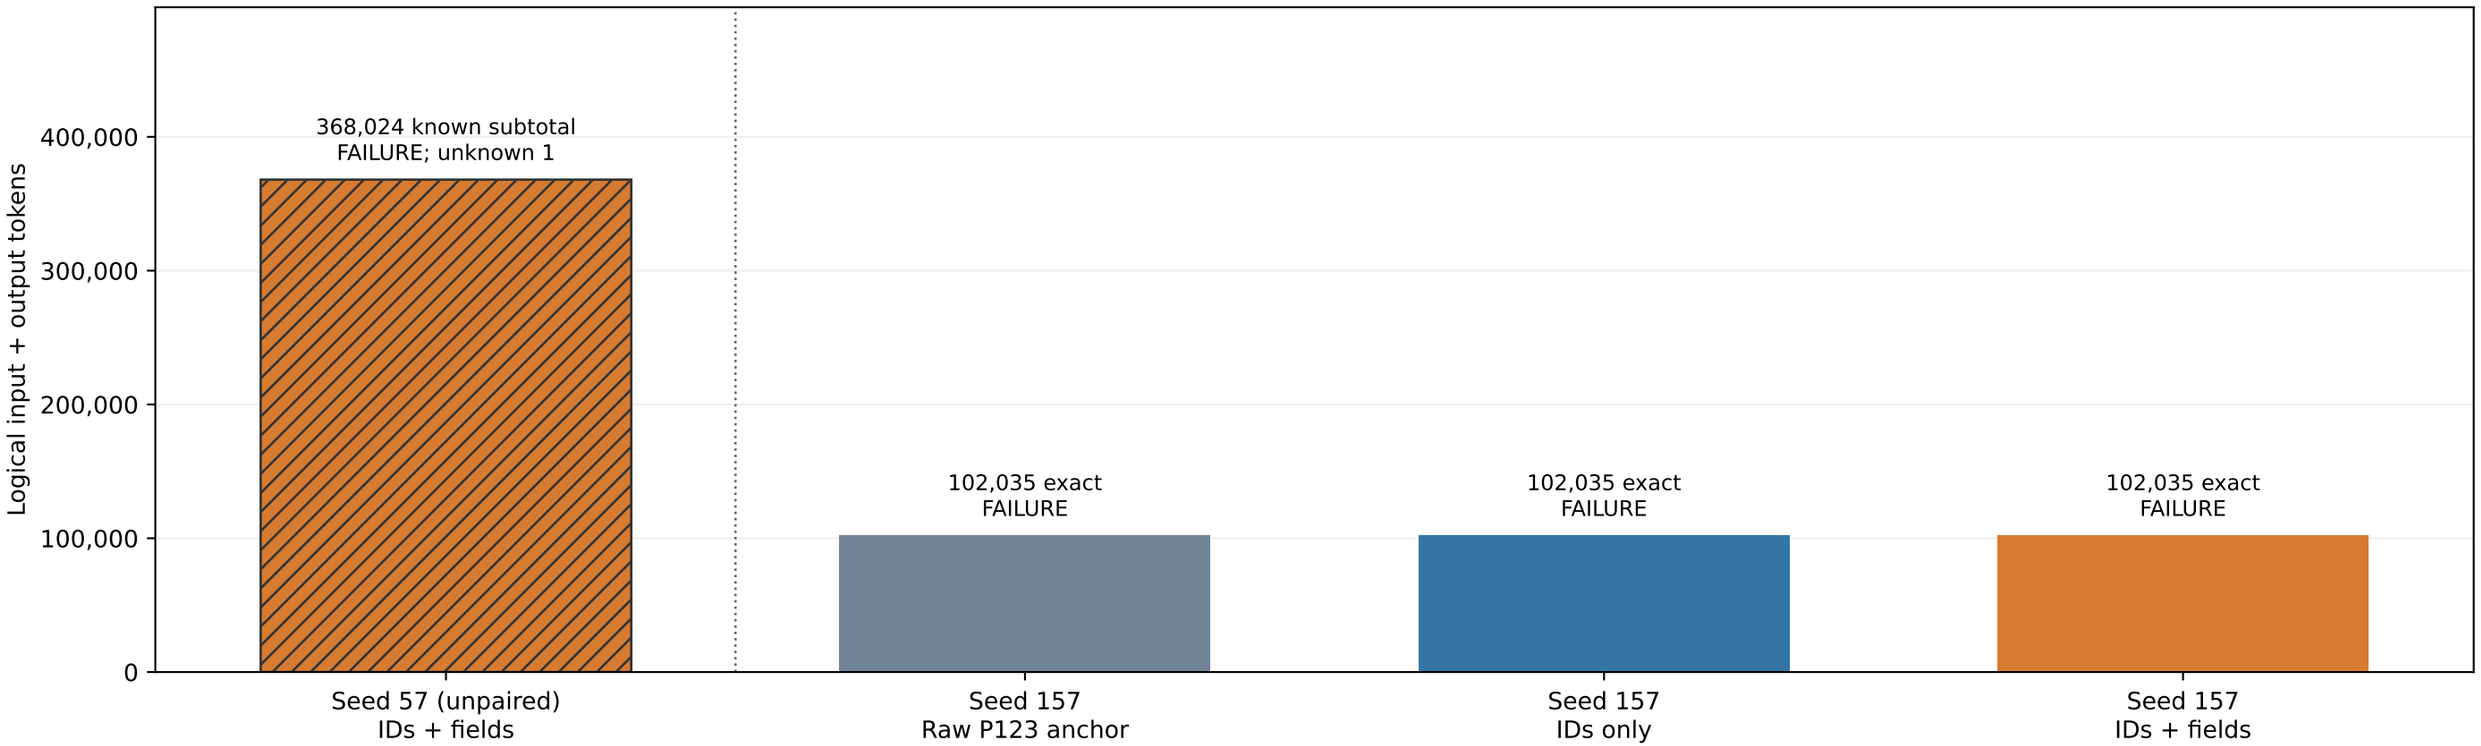
P137 — Whole-job cost and official outcome

All 4 new slots: seed57 fields is unpaired; seed157 has 3 modes. No P136 outcomes or costs are pooled.



Comparison	Seed157 pair: Δ tokens	Common successes	Common-success Δ	Gain/loss/both failed/not evaluated
PRIMARY: fields − IDs	+0	0/1	unmeasured	0/0/1/0
ANCHOR: fields − raw	+0	0/1	unmeasured	0/0/1/0

Adoption gate (not evaluated): False. Negative differences mean fewer tokens, not automatically better quality.
Hatching = known subtotal plus unmeasured usage; × = usage unmeasured. No condition is omitted. Cached input is not subtracted.
Both comparison rows use seed157 only. Common-success costs exclude gains, losses and both-failed pairs.
Comparison-table 'unmeasured' also includes conservative descriptive null aggregates with some known components.
Seed157 is one descriptive pair; seed57 is unpaired. Unbalanced policy totals are not an effect comparison.
