P140 — Two separate comparisons; all eight task pairs

Primary utility gate: False | Unchanged-delta gate: False | BOTH required: False

T/R = threshold recursive; E/D = legacy exposure delta; E/DO = explicit object-only exposure delta. Max 2 opportunities in every arm.

PRIMARY UTILITY: E/DO − T/R

Pair	Δ logical tokens	Official outcome	Object focus K / U	Delta actor K / U	Strict / canonical prefix	Qualified intervention
Task 1	+0	Both successful	0 / 0	0 / 0	n/a / n/a	False
Task 2	+0	Both successful	0 / 0	0 / 0	n/a / n/a	False
Task 3	+0	Both successful	0 / 0	0 / 0	n/a / n/a	False
Task 4	null	SUCCESS LOST	1 / 0	10 / 1	n/a / n/a	True

All-task Δ null | Common success 3/4; Δ null | Common-success qualified intervention False | Fixed gate False

UNCHANGED DELTA CONTROL: E/DO − E/D

Pair	Δ logical tokens	Official outcome	Object focus K / U	Delta actor K / U	Strict / canonical prefix	Qualified intervention
Task 1	+0	Both successful	0 / 0	0 / 0	null / null	False
Task 2	+0	Both successful	0 / 0	0 / 0	null / null	False
Task 3	+0	Both successful	0 / 0	0 / 0	null / null	False
Task 4	null	Both failed	1 / 0	10 / 1	False / True	True

All-task Δ null | Common success 3/4; Δ null | Common-success qualified intervention False | Fixed gate False

K / U = actual dispatched calls with known / unknown terminal usage; a prepared offer or installation alone is not exposure.
Qualified intervention uses the fixed audit rule: known object-focus dispatch + known delta-actor exposure; the delta-control comparison also requires canonical prefix equality.
Strict and transport-ID canonical prefix evidence remain distinct. They are not semantic, hidden-state or whole-job causal guarantees.
null stays null: all/common differences require four known pairs; empty common-success sets remain null. A cheap failure does not preserve task quality.
A primary-only pass does not satisfy the separate unchanged-delta gate or adoption. Posthoc four-task, single-seed development comparison; no novelty/generalization claim.
