# P138 — Paired comparisons and fixed decisions

Primary utility gate: False | Both-control development gate: False

**PRIMARY: Exposure − Threshold 16k**

| Paired task | Δ logical tokens | Official outcome transition |
|---|---|---|
| Task 1 | +0 | Both successful |
| Task 2 | +0 | Both successful |
| Task 3 | +0 | Both successful |
| Task 4 | Not estimable | Success lost |

All-task Δ: Not estimable | Common successes: 3/4 | Common-success Δ: Not estimable | Fixed comparison gate: False

**TIMING CONTROL: Exposure − Fixed 3 turns**

| Paired task | Δ logical tokens | Official outcome transition |
|---|---|---|
| Task 1 | +0 | Both successful |
| Task 2 | +0 | Both successful |
| Task 3 | +0 | Both successful |
| Task 4 | Not estimable | Both failed |

All-task Δ: Not estimable | Common successes: 3/4 | Common-success Δ: Not estimable | Fixed comparison gate: False

Fixed report values are displayed unchanged; the plotter does not recompute gates or estimate missing effects.
Not estimable includes null aggregates under the fixed completeness rule, even when some component costs are known.
Common-success costs describe a selected subset. Both-failed cost differences are not evidence of preserved quality.
Dispatched predicate differences do not decompose the causal effect on whole-job cost. Prior cohorts are not pooled.
