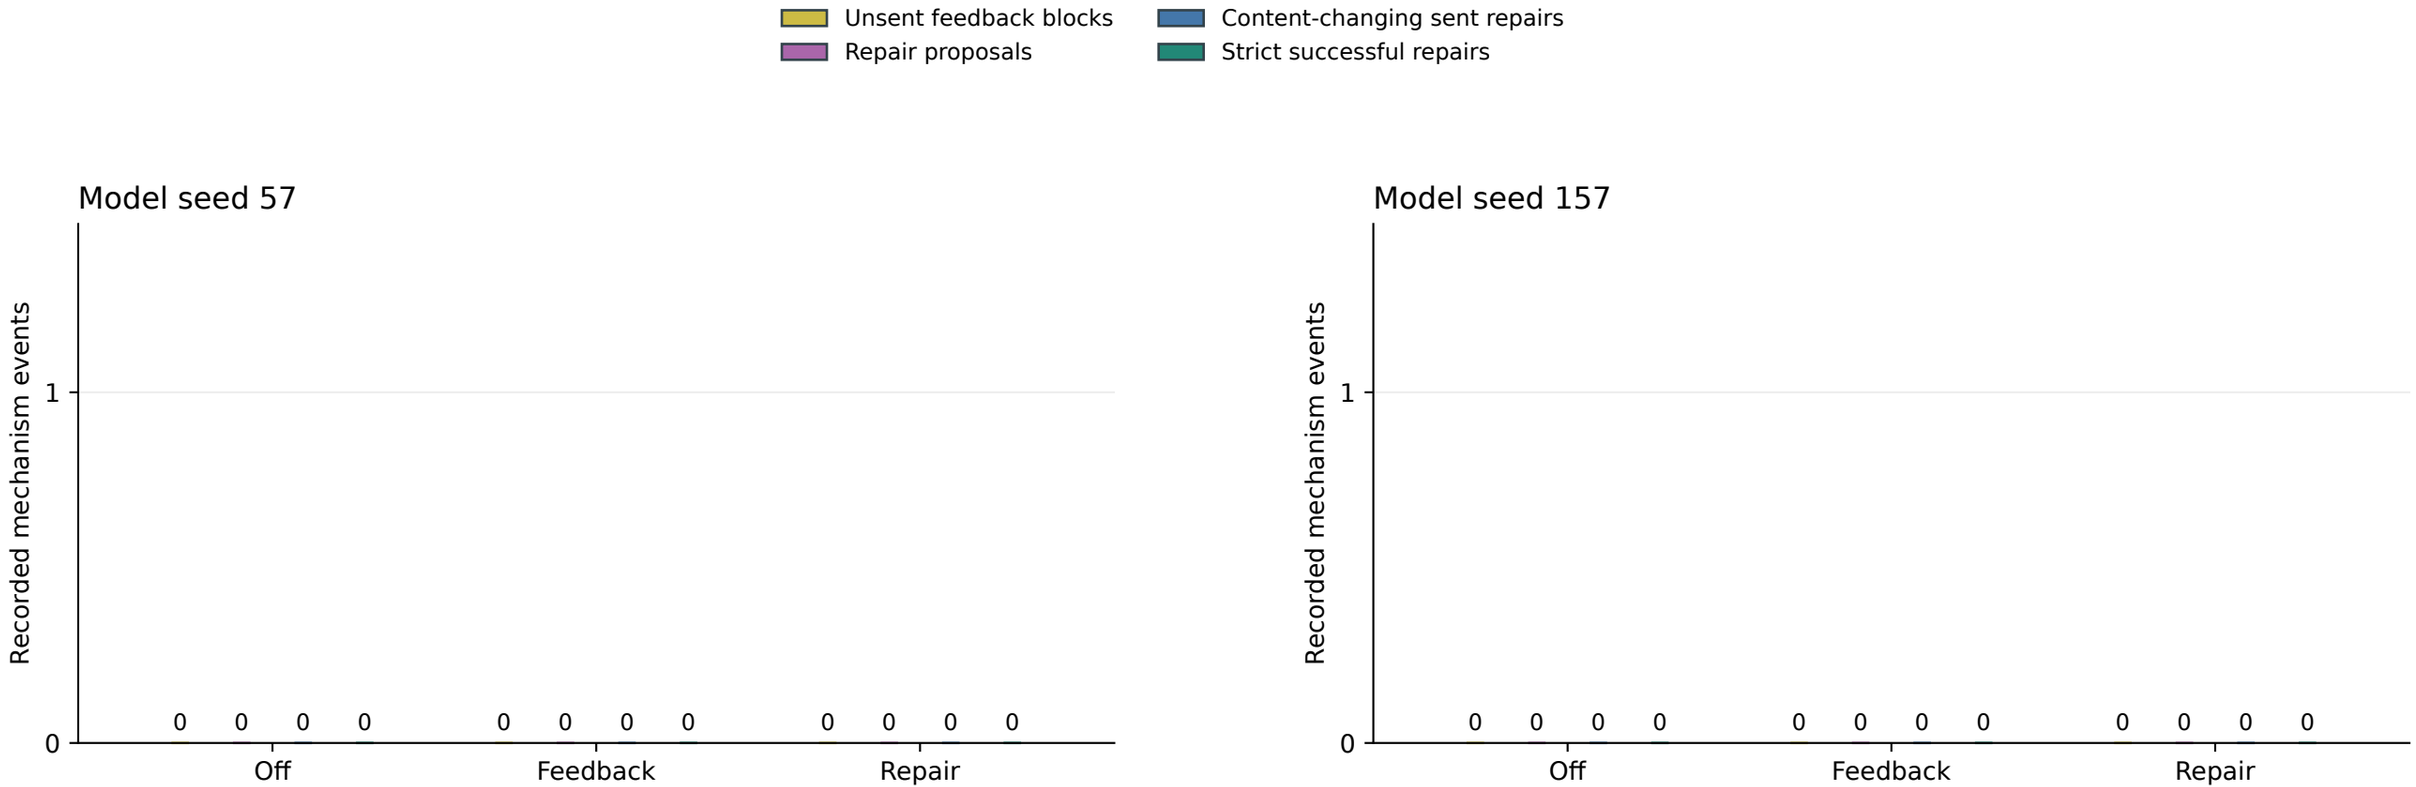
P129 — ordinary output-grounding calibration



Proposals, sent repairs and strict successful repairs are nested counts; they are shown separately and must not be added.
Strict success requires changed content, an actual send, a typed successful return and public-monitor backup support. It is not official task success.
Feedback blocks are unsent actions. Incomplete accounting uses an open triangle at the known subtotal; missing measurements use NA, never zero.
Counts, API/cache hits and reply bytes do not establish token savings. Overlapping times are not added. One known task; no novelty claim.
