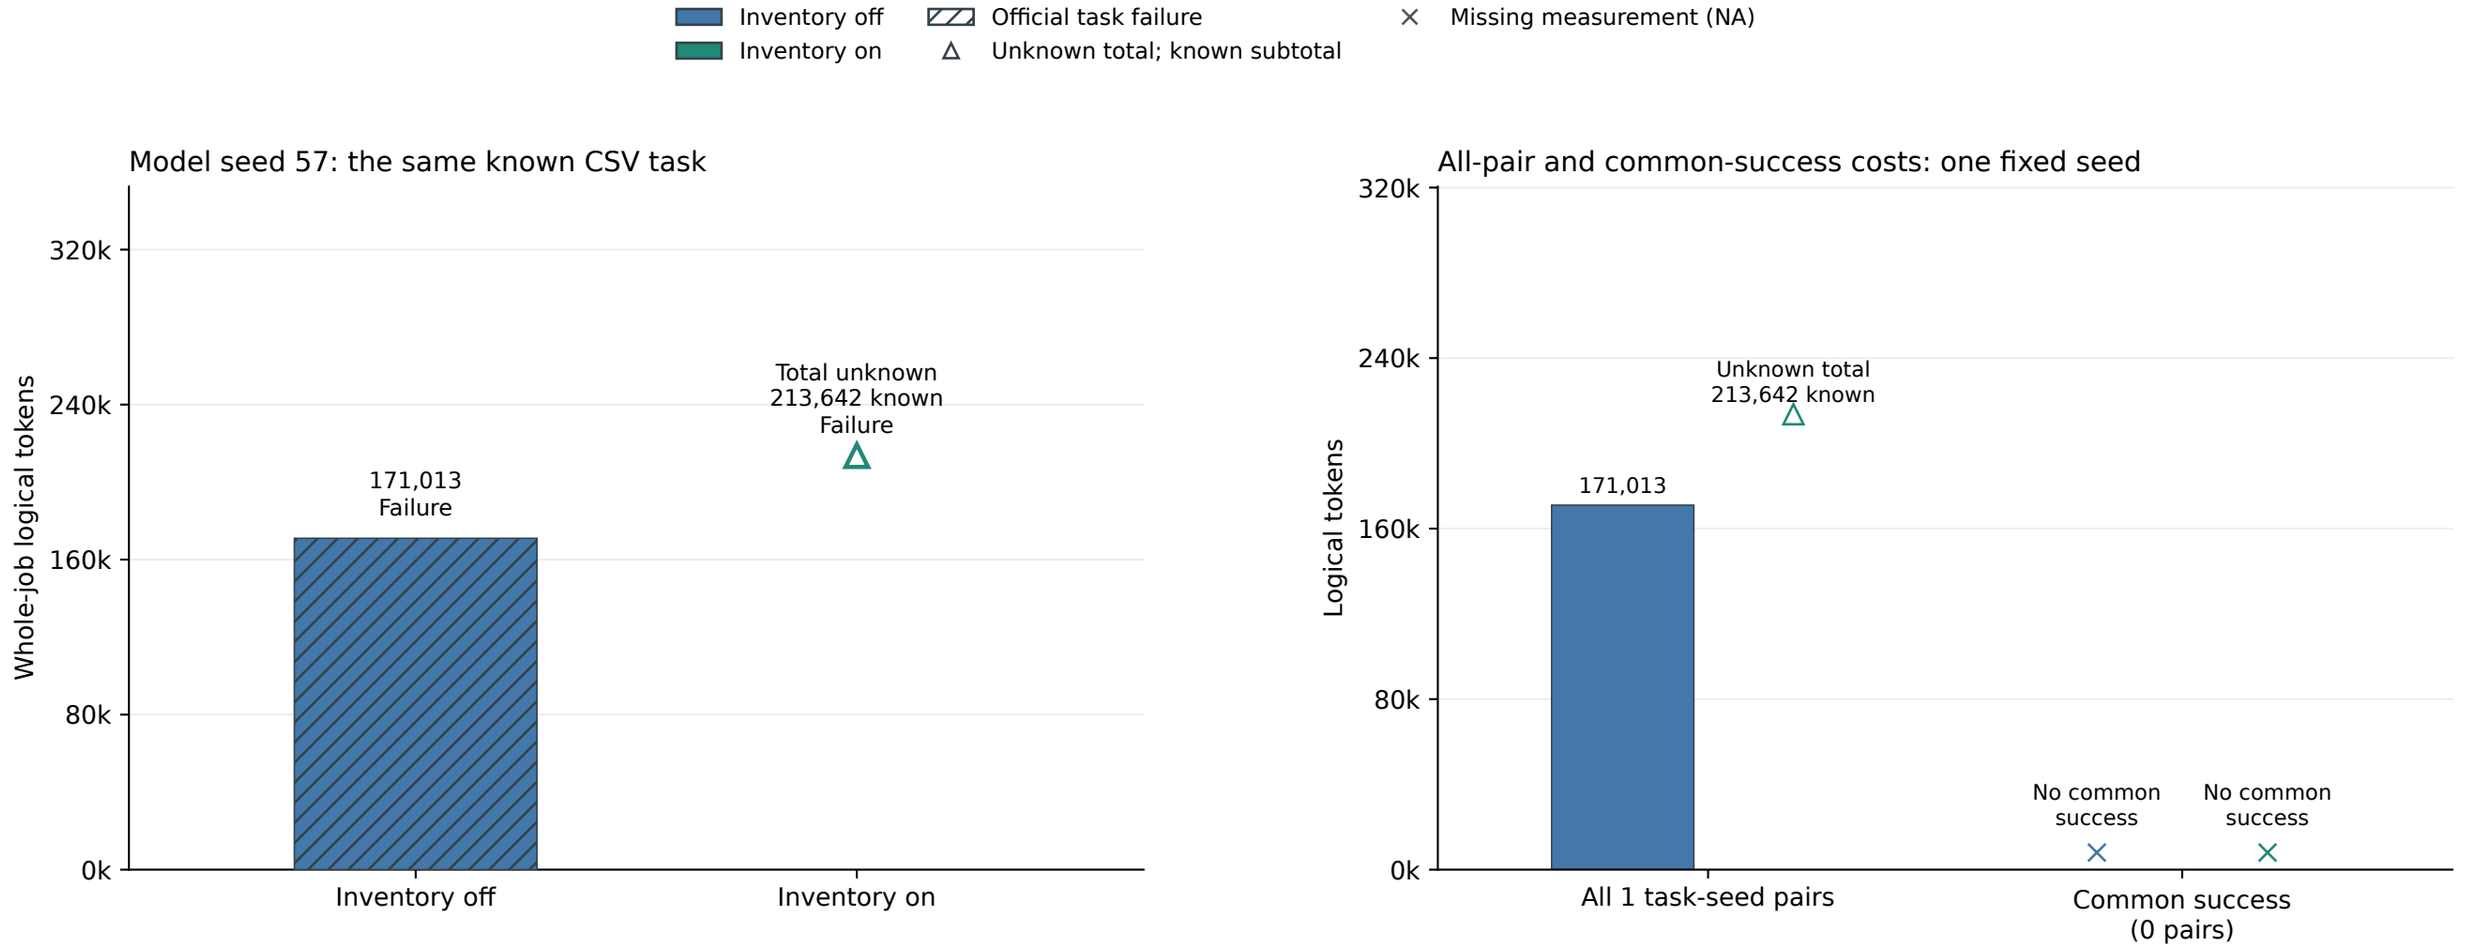
P132 — ordinary checkpoint inventory utility



Pairs: gain 0, loss 0, both failed 1, unassessed 0

Fixed development gate: False; audit errors: 0. One previously exposed CSV task, one fixed seed (57), two conditions.
Both conditions retained. Shared feedback guard, rolling checkpointing, full receipts and explicit-field interface; earlier attempts are not pooled.
Whole-job logical input + output includes actor/focus, summaries, inventory input, failed work, notices and recovery; cached input is not subtracted.
Unknown totals and missing cells are never zero. Cheap failures and quality gains are separate from same-success cost reduction.
Official success can coexist with a contract stop. This single pair supports no general quality, novelty or timing-superiority claim.
