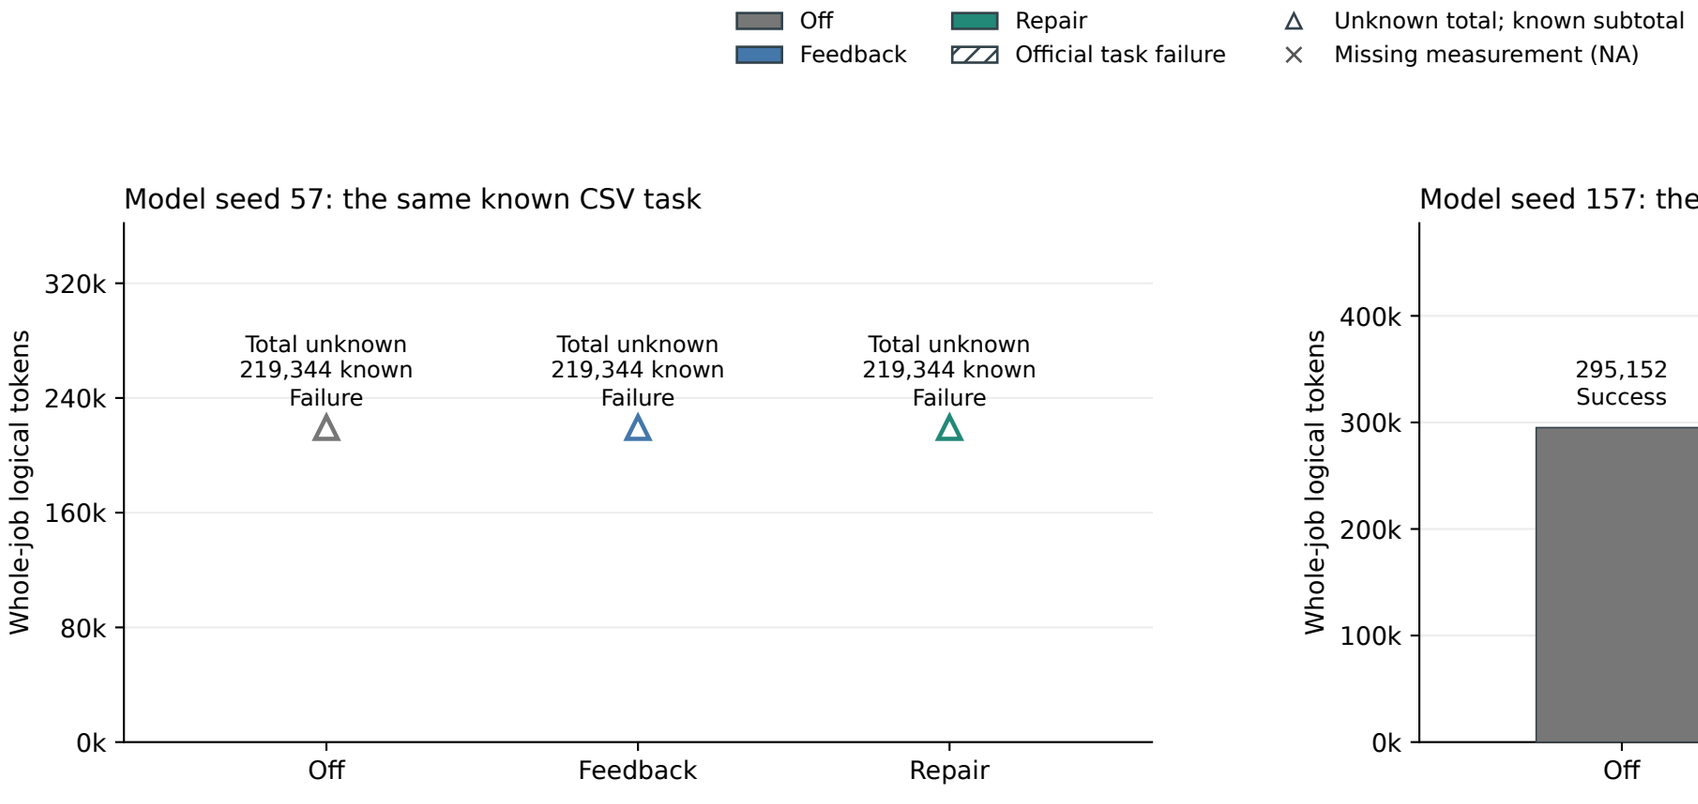
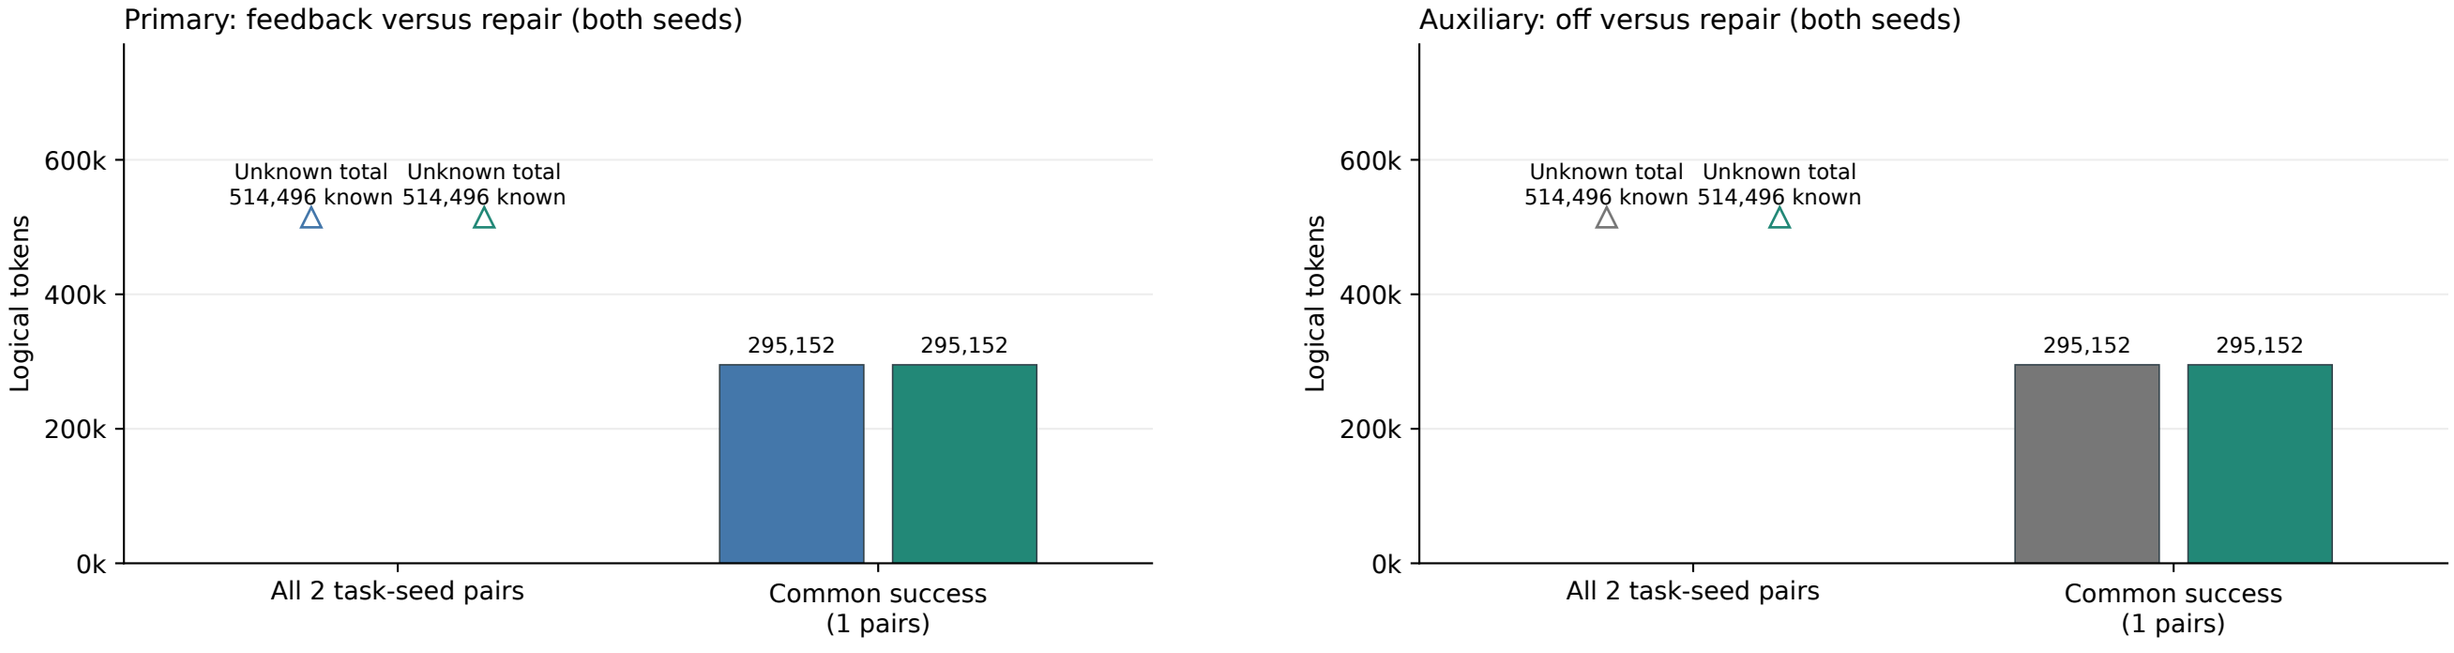
# P129 — ordinary output-grounding calibration





Pairs: gain 0, loss 0, both failed 1, unassessed 0

Pairs: gain 0, loss 0, both failed 1, unassessed 0

Off 1/2 observed successes, 0 unassessed; Feedback 1/2 observed successes, 0 unassessed; Repair 1/2 observed successes, 0 unassessed.

Fixed development gate: False; audit errors: 0. One previously exposed CSV task, two fixed seeds: not two independent tasks.

All six conditions retained. Logical input + output includes actor/focus, summaries, failed work, notices and recovery; cached input is not subtracted.

Cheap failures and quality gains are distinct from same-success cost reduction. Official success can coexist with a contract stop.

Unknown totals are never zero. Common success requires both compared modes to succeed on the same task and seed. No general quality or novelty claim.
