Supplementary results: all twelve P144/P144R1 conditions

Author details pending

29 October 2026

This supplement accompanies the v04 letter draft. It reports a closed development comparison on four known tasks (model seed 257, world seed 42). It is separate from the positive P123 and P64/P66 studies in the letter. The original two executions (session S0) and ten continuation executions (session S1) are linked without hiding the user-requested shutdown. The second S0 execution was evaluated once from its saved state after resumption; neither S0 execution was regenerated.

Table 1: All twelve physical run identities, in execution order. Tokens are known logical input plus output, including cached input and focus calls. Unknown calls are counted separately, never imputed as zero.

Physical run ID	Session	Success	Known tokens	Unknown calls
BOC_P144_01_THRESHOLD_RECURSIVE	S0	Yes	163,103	0
BOC_P144_01_THRESHOLD_DELTA_OBJECT	S0	Yes	138,772	0
BOC_P144R1_01_THRESHOLD_DELTA_UPDATE	S1	Yes	150,832	0
BOC_P144R1_02_THRESHOLD_DELTA_OBJECT	S1	Yes	218,852	0
BOC_P144R1_02_THRESHOLD_DELTA_UPDATE	S1	Yes	297,895	0
BOC_P144R1_02_THRESHOLD_RECURSIVE	S1	Yes	205,862	0
BOC_P144R1_03_THRESHOLD_DELTA_UPDATE	S1	Yes	61,415	0
BOC_P144R1_03_THRESHOLD_RECURSIVE	S1	Yes	61,415	0
BOC_P144R1_03_THRESHOLD_DELTA_OBJECT	S1	Yes	61,415	0
BOC_P144R1_04_THRESHOLD_RECURSIVE	S1	No	91,992	0
BOC_P144R1_04_THRESHOLD_DELTA_UPDATE	S1	No	401,625	0
BOC_P144R1_04_THRESHOLD_DELTA_OBJECT	S1	No	247,647	1

Task slots 01–04 denote photo operations, settlement, refund, and CSV processing. RECURSIVE (TR), DELTA_OBJECT (APP), and DELTA_UPDATE (UPD) denote ordinary recursive summarization, append-style state, and explicit state-update requests. All three modes succeeded on 3/4 tasks; all failed on CSV. The TR and UPD CSV runs reached the API cap. APP CSV stopped during a model call at the wall-time limit and retains one unknown-usage call.

Table 2: Preserved mode-level accounting. The original global exact-total fields remain null because the three-mode cohort has unknown usage.

Mode	Successes	Known subtotal	Unknown calls	Global exact total
TR	3/4	522,372	0	null
APP	3/4	666,686	1	null
UPD	3/4	911,767	0	null

The separately defined TR–UPD comparison has known usage in all eight cells. UPD uses 389,395 more tokens (+74.54%) over all four tasks and 79,762 more over the three common-success tasks. These exact pairwise differences do not fill the null three-mode totals or the missing APP comparison differences. Three known-usage focus calls requested explicit updates, but zero updates were installed and zero changed old-state items reached subsequent known-usage actor calls. No efficacy or novelty claim follows. The split server sessions also prevent interpreting this as an isolated causal effect of the mechanism.

Evidence: `reports/P144R1_continuation.json` and `reports/P144R1_closed_validation_20261029.json`. All rows and preserved source hashes are available in `P144R1_all_conditions.csv` and `P144R1_results_data.json`. This standalone supplement is distinct from the four-page letter body; journal acceptance of supplementary files has not been established.
